What is a WATER WARNING SYSTEM?

Clean fuel is necessary for the seamless operation of all engines, and a prerequisite for their effectiveness. The demand for clean fuel from the continuously advancing engines is increasing.

This product series offers a simple but unique solution to this problem. Combining multiple benefits such as low price, easy installation, and a guarantee. It gives you a timely and valid warning of water in the fuel line of your engine.

The Water Warning System (WWS) is a system to detect water in fuel, as one can easily understand from its name. The detection mechanism consists of a simple yet smart and patented electronic circuit, which will detect the existence of water in the fuel. Once the water levels reach a critical point, the system will warn the user with audio and visual means, in an attempt to prevent the water from entering the engine. Such a system will not only protect your engine, but the systems around it as well and help to prevent breakdowns at sea. WWS is the ideal solution for protecting your engine from water in the fuel.

Four versions of the Water Warning System are available, the S1-200, the S2-400, the G-200, and the G3. Each version has special characteristics for special occasions, however all versions will serve the same common cause: valid and timely warning for water in fuel.

PROTECT YOUR ENGINE WITH AN ADVANCED WATER WARNING SYSTEM FOR GASOLINE AND DIESEL ENGINES. AVAILABLE NOW FROM OSM BOATS. CONTACT US NOW FOR FURTHER INFORMATION.
